Education

SRM IST-Trichy

B.Tech · Computer Science and Engineering

2027

CGPA - 8.49/10

MSM HSS School

Class XII - Department of Higher Secondary Education · PCMB · Kallingal paramba

2022

Percentage - 90.08%

MSM HSS School

Class X - Kerala Board of Public Examinations · SSLC · Kallingal Paramba

2020

Percentage - 95%

Skills

Programming Languages: C++, Python, HTML, C

Tools and Technologies: MS Office

Areas of Interest: Adobe Premier Pro, Adobe Illustrator, Adobe Photoshop

Hardware Skills: Computer Hardware Troubleshooting

Domain Knowledge: Internet of Things

IoT (Internet of Things)BASED SOLAR SUN TRACKER USING ARDUINO UNO

Jan 2025 - May 2025

| [Link](#)

· C/C++,python

IOT

▪IoT Based Solar Sun Tracker Using Arduino Uno▪ combines embedded control with IoT connectivity.

- **Hardware Layer (Arduino)**

- Arduino Uno reads input from four LDRs and controls two servo motors to align the solar panel.
- Implemented in Arduino C/C++, using a greedy algorithm to always move toward the brighter direction.

- **IoT/Data Layer (Python)**

- A Python program communicates with the Arduino (via serial or Wi-Fi module like ESP8266/ESP32).
- It collects sensor readings (light intensity, panel angle, etc.).
- Python then sends this data to the internet/cloud (e.g., Blynk, ThingSpeak, or MQTT broker).
- Enables remote monitoring and logging of solar tracker performance.

- **Advantages**

- Dual-axis movement ensures maximum solar energy capture.
- Python adds real-time IoT integration, making the system suitable for industrial monitoring.
- Scalable for larger solar farms with centralized data dashboards.

Digitize and automate water supply management | [Link](#)

Database Management System.

The **Water Management System (WMS)** is a simple yet powerful web-based platform built to make water supply management easier for both residents and administrators. In many cities, updates about water distribution still come through newspapers or word of mouth, and billing is handled manually. This often leads to confusion, delays, and frustration. Our project solves these problems by creating a **centralized, digital system** where everything can be managed in one place. The system is built on a **MySQL database**, carefully designed and normalized to avoid errors and duplication. The frontend uses **PHP, HTML, CSS, and JavaScript**, while backend tasks like user registration, placing orders, and tracking deliveries are automated with **PL/SQL procedures**. For added flexibility, Python with **Tkinter** can also be used for a simple GUI. Users can easily sign up, log in, order bottled water or related products, check their schedules, pay bills online, and track deliveries. On the other side, administrators can manage users, products, orders, and reports through a clean dashboard.
